a. Using the graph below, calculate the rate of the reaction between the second and the fifth minute. Rate = slope = 44mL \div 10mL = 11.3 mL/min. 5min \div 2min. When is the rate of the reaction the greatest? Slope was steepest = 3-4 min. time interval. When does the reaction stop? When slope = 0, rate = 0 = reaction is over. 5 min.

The factor which is equal at equilibrium is to be ...

At equilibrium, the rate of forward is equal to rate of the backward reactions. This does not imply that the concentrations of reactants and products are equal. At equilibrium, reactants and products both are getting formed as a result of backward and forward reaction. The rate of forward as well as ...

True statement is to be given. Concept Introduction: At ...

Since the rate of the forward reaction increases more than the rate of the reverse reaction, Kc increases (numerator, [products], is larger and denominator, [reactants], is smaller). Kc = $\frac{[products]}{[reactants]}$ 17.2 The faster the rate and greater the yield, the more useful the reaction will be to the manufacturing process. 17.3 A system at equilibrium continues to be very dynamic at the molecular level.
