...

Published: March 15, 2016

Our solar system is made up of a star—the Sun—eight planets, 146 moons, a bunch of comets, asteroids and space rocks, ice, and several dwarf planets, such as Pluto. The eight planets are Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, and Neptune. Mercury is closest to the Sun. Neptune is the farthest.

Moons in the Solar System.

There are currently 181 known moons in our solar

system orbiting the various planets and dwarf planets.

Of the 13 planets and dwarf planets, there are four which don't have any moons.

These are the planets

Mercury and Venus, and the dwarf planets Ceres and Makemake.

and on Earth, life itself!

The inner solar system is occasionally visited by comets that loop in from the outer reaches of the solar system on highly elliptical orbits. In the outer reaches of the solar system, we find the Kuiper Belt and the Oort cloud.

Our Solar System Sun Facts

The Sun is the largest

object within our solar

system, comprising 99.8% of

the system's mass. The Sun

is located at the center of

our solar system, and Earth

orbits 93 million miles away

from it. Though massive, the

Sun still isn't as large as

other types of stars. It's

classified as a yellow dwarf

star.

Ganymede, a satellite of Jupiter, is the largest and most massive of the Solar System, it is the largest without a substantial atmosphere. It has a diameter of 5.268 km and is 8% larger than the planet Mercury, although only 45% as massive. The Moon likely has a salty ocean underneath it's icy surface, making it a potential location for life.
