IPC Users Guide. Inter-

Processor

Access Free Ti Ipc User Guide

Communication (IPC) provides a processor-agnostic API which can be used for communication between processors in a multi-processor environment (inter-core), communication to other threads on same processor (inter-process), and communication to peripherals (inter-

device). The API supports message passing, streams, and linked lists.

~~IPC Users Guide~~

~~Texas Instruments Wiki~~

IPC is a component containing packages that are designed to allow communication between processors in a multi-processor environment and communication to

Access Free Ti Ipc User Guide

peripherals. This communication includes message passing, streams, and linked lists. These work transparently in both uni-processor and multi-processor configurations.

The IPC product contains an examples/archive directory with device-specific examples. Once identifying your device, the examples can be unzipped anywhere on your build host.

Typically once unzipped, the user edits the example's individual products.mak file and simply invokes make.

The ti.sdo.ipc.Notify module manages the multiplexing/demultiplexing of software interrupts over hardware interrupts. In order to use any Notify APIs, you must first call Ipc_start(). This sets up

all the necessary Notify
drivers, shared memory,
and interprocessor
interrupts.

IPC provides an
implementation of the
IMessageQTransport
interface called ti.sdo.ip
c.transports.TransportSh
m (shared memory).

Access Free Ti Ipc User Guide

You can write other implementations to meet your needs. When a transport is created via a transport-specific `create()` call, a remote processor ID (defined via the MultiProc module) is specified.

Overview. IPC is a generic term of Inter-Processor

Communication referred widely in the industry, but also a package in TI Processor SDK for multi-core communication. In generic usage, there are different ways for multi-core communication such as OpenCL, DCE, TI-IPC, and etc. In TI's IPC package, it uses a
